Press Release

May 28, 2013

Next-Generation X-Class Machines Achieved Total Sales of 5,000 Units

This is to report that our next-generation X-class machines have achieved **total sales of 5,000 units** in April 2013.

The X-class, evolved from our best-selling N series, has been designed based on the requests and demands we received from thousands of customers for the N series. The X-class machines are capable of achieving high precision, high quality and high reliability, which makes themselves investment-worthy for customers.

We have been expanding the X-class variations in response to customers' needs for high-speed, high-precision machining since September 2010 when we launched a high-rigidity, high-precision CNC lathe, the NLX2500, as the first X-class machine. We can now proudly offer each series of the X-class that is equipped with distinctive and outstanding features to meet a variety of customers' needs: the NVX series, high-rigidity vertical machining centers that employ slideways on all axes; the NHX series, high-precision horizontal machining centers that are equipped with a direct scale feedback as standard; the NTX series, compact integrated mill turn centers that enable high-precision complete machining; and the NZX series, multi-axis turning center equipped with up to three turrets to achieve high-efficiency machining.

In 2013 we began to offer wide ranges of optional packages to meet customers' various machining requirements. It enables customers to quickly and effectively choose the optimal option for them. The packages currently available include spindle, chip disposal, coolant, high-precision, measurement system, robot system packages.

The X-class sales volume has been on the rise since its release, and we received as many as 2,361 orders of the machines mainly from the automotive and aerospace industries in 2012. The sales achievement is a proof of the X-class being with no doubt highly reliable machines that have been widely appreciated from customers.
